# Liquid Galaxy Use Case For The Elderly

December 22, 2017

By Tarun Ravi

It's no secret that we're getting older by the second. From the day we were born, it's been slowly counting down... Elders usually have lots of time on their hand, and sometimes don't know what to do with it.

Eventually, they get tired of what they're currently doing and look for something else to do. With Liquid Galaxy, Elders can finally do something with all that free time. Liquid Galaxy. In Layman's terms, Liquid Galaxy is a virtual like environment, composed of multiple of sharp displays as can be seen in the image above. These displays 'blend into each other' to create a fluid user interface. The user then can easily control this, by navigating through the simple to use app and joystick. Liquid Galaxy will improve the lives of senior citizens because senior citizens will be easily able to use and navigate through this interface, would be able to virtually travel anywhere they want to go and would be pass time.

---

Many futuristic products with great potential, are quickly ignored or dismissed due to their complex nature and impossible to understand interface. These products, never get the support from elders. As they are

the ones who, require and need a simple interface. While some 'simple interfaces' are too complex for them. With Liquid Galaxy, the stereotype that old people can't do modern things end. The user interface is well beyond simple and straight forward. The user interface, is composed of well sized boxes, with clear labeling what they do - with one click its up. Once the media is played to the displays, the user is able to use a joystick to control what is played in the displays.

With Liquid Galaxy anyone, including elderly, can experience a virtual like environment. With Liquid Galaxy, the viewer will now get full panoramic experience that stretches beyond the viewers' peripheral vision, totally surrounding them in another place. In addition to sharp 4K

---

displays, Liquid Galaxy is capable of audio playback, which would ensure a true and deep immersion. Elders could virtually travel and see their grandkids, and spend more time with their family. They also could virtually travel to any location in the World - using Google Earth. Due to Liquid Galaxy's implementation of audio - the user will truly feel like they traveled somewhere else.

Liquid Galaxy has enormous power and can do a lot more, then it says. As Liquid Galaxy is, in essence, a powerful computer. It can do anything a traditional computer could do. Liquid Galaxy could be used as a gaming console - allowing a virtual like experience. However, if complex games are'nt your type - you could easily play the biggest game of solitaire you want. In addition to gaming, you could do traditional tasks like web browsing, reading or checking email. After all that, you could relax, and watch some videos on a gigantic Liquid Galaxy screen. With Liquid Galaxy the possibilities are infinite.

Overall, with Liquid Galaxy will improve the lives of senior citizens because senior citizens will be easily able to use and navigate through this interface and would be able to virtually travel anywhere they want to go and be able to pass time.
